

Release 1.0.0

Version 1.0.0 contains many updates to the application, including adding webpages and routing to ensure that users can interact with the application.

What's New:

- The login page has been added to the system, allowing users to have a page they can view including a form which is utilized for submitting and re-routing them to the home page.
- The registration page has been added to the system, allowing users to have a page they can view with a form which is utilized to initialize their account and will redirect them to the login page when the form is submitted.
- The message partial has been added to the system, allowing users to be provided with a message when an error occurs, currently on the login and registration page.
- When the user goes to the route `/game`, the game page will be rendered to show an example skeleton of what the game will look like when it is available for users to interact with.

What's Upcoming:

- A user database will be implemented to allow users to create their accounts and login using their credentials.
- The login and registration routing will implement the database to prevent users without accounts from accessing the app for session authentication. Additionally, there will be error messages implemented into webpages to inform users of any errors that have occurred.
- The game page will have additional aspects added for styling and error handling to ensure that any possible errors will not cause any severe problems.
