

TA Meeting 11/11

- Discussed with the TA about what we had done throughout the week and our gameplan for next week
- Decided we would need to work with the TA on Thursday during lab on figuring out our API and how we should implement it to connect with our database

Team Meeting 11/12

- Looking at the changes to the API after we switched it to using JS for the API
- We looked at a different background for the game to make the styling look better
 - Reeves decided he wants to work on restyling some of the pages including the home and settings page this week
 - Emma is going to work on making sure that for login/registration that all information is being properly checked and error messages are added
 - Add bootstrap error messages that will pop up so the information is saved from the form if there is an issue with registration
 - Josiah will be changing the styling of the game page to have an exit game option and a profile image so that users can exit the game and go to their profile (which both will make them leave the game)
 - Karthik and Joel are working together on the API and storing the information for the games into the database as we have issues
- We discussed the scoring method because we had not previously guessed:
 - Everyone starts off with 20 points per letter
 - If you are cold: lose 20 points
 - If you are hot: lose 5 points
 - If you are in the middle: lose 10 points
 - You get a total of 10 guesses, if you run out of guesses you get 0 points.
-

Tasks

Before Lab Tomorrow:

- Guesses connected to the database (Joel and Karthik)
- API connected to the database (Joel and Karthik)
- Settings page will be added with the routes to logout and go back to the home page (Reeves)
- Create the exit button for the game and get the routing figured out for it (Emma)
- Implement validation for the registration (email and passwords) - (Emma)
- Discuss having game sessions

Before next meeting:

- **Emma** - work on more unit test cases and implementing checks for the login/registration pages. Implement the handlebars for the pop up for the end of game and add the routing to all the buttons
- **Karthik** - better word generation through the API, fix the masking on the similarity guesses
- **Josiah** - front-end of the game page for the guesses (telling the user whether hot or cold and the points), figuring out a better way to clear the guesses
- **Joel** - Working on connecting the API to the database, figuring out how to get the scoring into the database, and implementing the scoring to the database to ensure scoring accuracy
- **Reeves** - Settings page running, update the home page style, decide whether the settings, update general styling for the entire game to make it more presentable and user friendly, create the template for the pop up for the end of game, add category button: music, sports, holidays, and movies.
