Application Name	Application Name • Ideas ○ Word par Finalized name: Word par
Application Description	In our application, we will provide users with a game that challenges their intuition about popular subjects. The game will be modeled after Wordle but will offer a golf-like experience. After choosing a category, the user will be prompted with a phrase. They will then be challenged to guess the correct word, for which each guess counts as a stroke. If the user is stuck, they will be allowed to take a hint for a stroke penalty. Our application offers value to the user in terms of entertainment, as it provides a fun alternative to popular word games like Wordle. Note, our application contrasts Wordle in the fact that multiple games will be offered per day, instead of just the one in Wordle. The words that the user will guess will be approximately 7-9 characters for the easy, default mode, with an alternative hard mode providing words over 12 characters. Users will automatically be set to the default mode, but can switch to the hard

	mode at their discretion. There will also be a category leaderboard for the top 10 players in the game, ranked by total points accumulated throughout the game. Since the game is modeled after the game, the leaderboard will be organized by the lowest points total for that day. There are 4 category options: holidays, movies, music, and sports. Based on the chosen category, the AI API will, in real time, select a word of 7-9 characters, depending on the chosen difficulty level. Each guess counts as a stroke. • Layout of our website ○ A login page with an option to register at the bottom if not already registered ○ A registration page which requires users to create an account ○ A home page where you choose the category with a leaderboard and a player button with a button in the upper right corner for user details ○ A play page where users play the game with a win/lose pop up for when the game ends ○ A pause page for when users need to pause the game for a moment ○ A settings page for the user details where users can change their password and other details
Audience	• College Students • People seeking for a nuanced version of Wordle • People who like puzzles and word games; Problem we are solving: Provides a new option for those who enjoy puzzles and word games, a more challenging option than Wordle where they can compete with others, cultivating a community. The game will be easy to see by preventing clutter on the screen for those who have worse vision, while keeping a simple layout to ensure focus for those who may find it difficult to focus with ads and multiple things going on on the screen.
Vision Statement	For puzzle and game enthusiasts, who are looking for an entertaining puzzle. Word Par is a puzzle game that combines golfing and Wordle to create a unique experience. Unlike Wordle, our product aims to create a user experience rather than just a simple puzzle.
Version Control	*This section can be found in the repository

Development Methodology	• Agile Method • Kanban board to keep track of tasks
Communication Plan	During the project, we have decided to communicate utilizing Discord where we will be using different channels to communicate different topics/ideas with a general channel to share our progress and tasks we will be getting done.
Meeting Plan	• TA - Meeting Tuesdays at 1 pm on Zoom • Team meeting ◦ Wednesdays at 4:30 after class in the Library ◦ Send a message in Discord on Sunday about what you completed this week, and what you plan to complete before Wednesday.

***Use case diagram and wireframes can be found on their own in the repository**

EXTRA CREDIT SECTION: Five potential risks

Risk	Severity	Description	Mitigation
Merge conflict	High	With multiple devs working on same files can cause merge issue	Make sure everyone is working on their own branch and is also working on the most up-to-date main branch. Also, delegate one person to commit and merge all branches into the main branch.
API integration failure	Medium	AI API may have some downtime and have a limited rate	Test API endpoints early and cache results
Database errors	Medium	Wrong environment variables or schema	Store connection string on .env file, test using

		mismatch can break the server	docker and postgres
Scope	Medium	We only have 4 weeks to work on this project so time is not on our side	Communicate efficiently. Make sure to work on the important stuff before getting to detailed
Security bugs	Low	Password and user security are not too important for this lab in the sense that it won't be used for large public use. But we should ensure passwords are stored correctly	Use bycrypting for hashing.

Additional Information:

General Files needed:

1. Docker file
 -
2. .env
 -
3. Postgres / sql
 -
4. Resources (HTML, CSS and any images)
 -
5. Views (Handlebars)
 -
